Expand your space for Manufacturing

McQuillen Boiler Services expand their processes with a temporary industrial building

McQuillan Boiler Services has built a strong reputation as a trusted expert in industrial and commercial boiler systems. As demand for their services grew, the business needed to expand their manufacturing operations. To meet their production requirements, McQuillan Boiler Services needed a facility with at least 7 meters of internal clearance, allowing them to accommodate a robust overhead crane capable of positioning their boilers.

Solution:

Aganto installed a 10m x 30m insulated structure with a height of 7.2m. The structure also featured solid gables, providing additional durability for their heavy-duty equipment. This design also allowed for the installation of an overhead crane, giving McQuillan Boiler Services the height needed to manoeuvre their large industrial boilers.

Once the order was confirmed, our team was able to begin the installation quickly. On-site preparation began just four weeks later, and the installation was completed within a just six days to reduce the impact on day-to-day operations. From initial order to the final installation, the entire process took only six weeks.

The new structure has greatly enhanced their manufacturing process. By allowing for crane-assisted lifting, McQuillan Boiler Services has significantly reduced the time required for assembling boilers, achieving a faster turnaround on production.

Features

- Insulated
- Pedestrian Access Doors
- Roller Shutter Doors
